Street Name Plates

TECHNICAL INSTALLATION GUIDE

Signposts are an important feature of any well planned street, nature reserve and general public places and provide information or direction to those that need them. Plaswood signs have attained a high level of credibility over a number of years and have proven to be the 'green alternative' to timber, metal and concrete signs.

Street Name Plates Installation

The 80mm square posts (legs of the sign) require a 450mm square x 450mm deep area, to both legs, for installation. Backfill with compacted concrete and use an anchor pin, long nails or metal peg, to key into the concrete and aid stability.

Posts would either be mortised or plain, depending on whether the backboards need to be recessed into the posts or face fixed. Backboards can have a maximum of 12-13 letters per line where road name allows.

Additional Options

All posts can have either flat, bevelled or chamfered tops which enhance the finish of the signs product. Corporate logos can also be added, along with various text and font styles.

We also offer Finger Posts, Waymarker Posts, Information Boards, Management Posts, Nature Reserve Signs, Nature Trail Signs and Roundabout Sponsorship Signs, which are all suitable for any outdoor environment.

General Notes

Plaswood signs have attained a high level of credibility over a number of years and have proven to be the 'green alternative' to timber, metal and concrete signs. They need little or no maintainence and have no scrap value, which are assets in themselves with the vandal problems experienced in many areas.

Street Name Plates

Sections used are 80mm square posts and 30mm x 100mm and/or 30mm x150mm for backboards.

Generally all street signs average 1220mm high overall but can vary in width, the backboards can either be face fixed or mortised into the posts with a capping to improve resistance

to vandalism. The drawing to the right is a typical example of a street nameplate and is not to scale.
